

ABSTRACT OF THE DISCLOSURE

A data management device for a communication installation including at least one base station having resources and at least one terrestrial node connected to a core network and to the base station to control its resources via an interface includes a control device coupled to a traffic source and to the interface and able to take local control, on command, of at least a portion of the resources of the base station, instead of the node, to enable transfer of data between the traffic source and the base station.
